In fact, you often trouble shoot analog telephone lines by going to the 66 punch down block, known in the industry as the “D Mark” and remove the bridging clips that connect the phone company with the customers phone equipment.

My Server is called Shoretel13, i keep it simple I would like to use the 'Trunk Test Tool' to test out my trunks now, but the TTT show me this message, 'Shoretel13: No Trunks Found' and Does not show me any trunks.. When you go back to platform hardware, define your trunks and put all of them in this group.. If you're wondering how you know which trunk would go to which group, well that depends on how you punched it down.. Clearly nobody is going to open 1000 ports in a firewall or you might as well not have a firewall! So a key functional requirement for a SIP trunk implementation is the ability to track legitimate requests to open a port and then to close it when the session is over.

I left 2 off the picture because they are fax and am bypassing the shoretel for these.. Is this where i would put in the analog phone numbers? Thanks, Glynn Ok, now that I'm in front a computer I can explain this a on the software side of things.. In this way you can easily determine which side of the block has the problem With SIP there si a new challenge: how do you separate the customer premise equipment from the telephone company provided network connection? Where does your network end and the telephone companies network begin?As we add SIP trunks to our network, the border of our network can easily disappear.. If you are integrating SIP Trunks with a ShoreTel iPBX, you will be very pleased with the Ingate "SIPParator" solution.. There is also a really handy tool called the Trunk Test Tool which allows you ShoreTel PBX does not register as a SIP trunk, but uses static SIP trunking instead.
